

Right now, when people use phone apps in Africa to send money or message friends, all the emojis and animations they see are generic and Western—like a basic green check-mark. Meanwhile, amazing local artists make cultural art that goes viral, but they never get paid for it.

**AfriGlyph** fixes this by paying local artists to create high-quality digital artwork that reflects real African slang and regional celebrations. We bundle this art into a digital library that companies pay a monthly fee to access. We are starting with digital banking apps, because they all look identical. Access to our library would make their apps feel **personal, local, and fun**. Every time a user sees a celebration animation on their screen, the artist automatically gets paid a royalty. By mastering these banking apps first, we intend to build the largest library of legally cleared African art in the world.

As a final frontier, this massive collection becomes an incredibly valuable training data source, attracting global tech giants and AI companies to pay us to license it so their computers can finally understand authentic African languages and culture.
